

# **Endpoint Secure**

## **Endpoint Security**

## The Future of Endpoint Security

Certification of the Best Windows Antivirus Solution and "TOP PRODUCT" Award by AV-Test

Recommended Windows Protection by

#### Enterprise-level endpoints face serious security challenges in a new era

Enterprise LAN endpoints and data have significant value to cyber criminals, putting endpoints, servers, software and hardware at serious risk of attack from complex and sophisticated viruses, ransomware and various other propagation modes. These serious endpoint security challenges as well as increasingly strict regulations on protection, management and applications make proactive endpoint protection critical.

#### o° Manual operation and maintenance increases the cost of defense

Traditional endpoint security products operate on common policies and characteristics, often based on more traditional organizational rules and operation regulations, designed to defend against threats from known sources. Organizations utilizing this more traditional approach to security, yet suffering attack from more complex and advanced threats, often experience an exponential increase in labor costs, while specialized enterprise O&M personnel have inadequate experience to effectively respond to the threat.

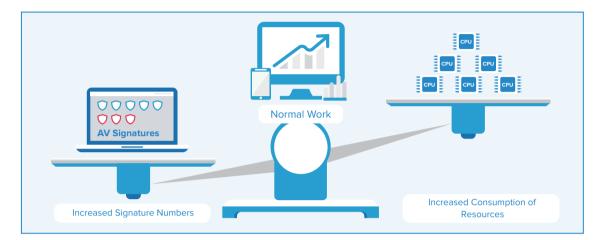

## Feature matching response to viruses is inadequate protection to new attack methods

In environments where there is constant risk from advanced threat, virus prevention methods utilizing the more passive antivirus database identification and response methods are often penetrated by newer viruses and ransomware. In addition, the limited capacity of local feature databases often fails to meet basic protection requirements against unknown and even some known viruses.

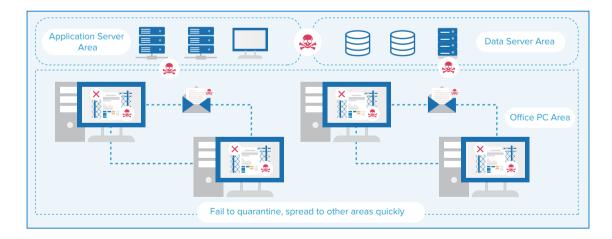

## (5) High-capacity antivirus feature databases lead to increased host computing resource costs

The gradual increase in quantity of antivirus feature databases increases the cost of endpoint storage and computing resources. When threat defense monopolizes a significant amout of work hours and employee effort, users are unable to focus on optimizationscenarios such as shifting to the cloud.

#### Outdated virus protection is incompatible with new propagation modes and virus environments

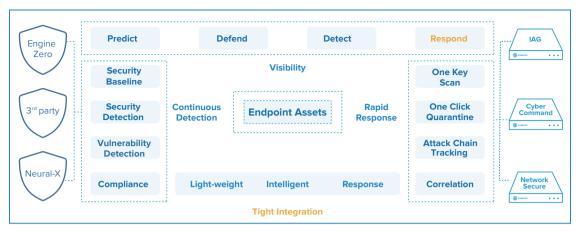

Virus killing based on the file isolation method is outdated, with failure allowing a single-point threat to spread quickly. New viruses and propagation modes are often able to bypass traditional antivirus products, which are not designed to adapt to new threats and environments.

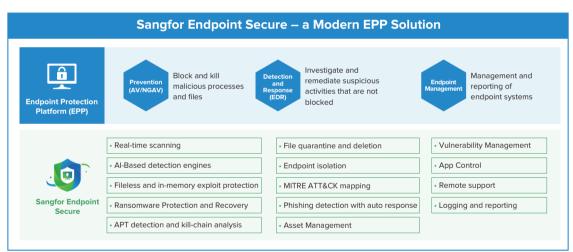

#### Sangfor Endpoint Secure

Sangfor's Endpoint Protection and Response platform (Endpoint Secure) provides the endpoint with a more detailed isolation policy, enabling more accurate search and destroy capabilities, sustainable detection capabilities and faster processing capabilities including prevention, defense, detection and response. Endpoint Secure is constructed through cloud linkage and coordination, threat information sharing and multi-level response mechanisms. Advanced threat response is immediate, with Endpoint Secure providing users with assistance dealing with any endpoint security problems by way of its new, light-weight, intelligent and instantaneous endpoint security system.

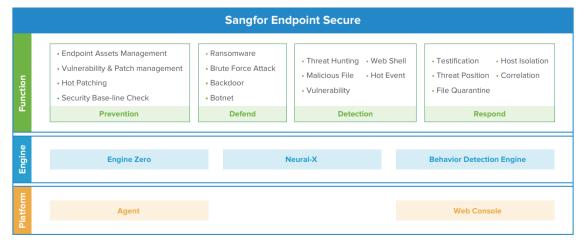

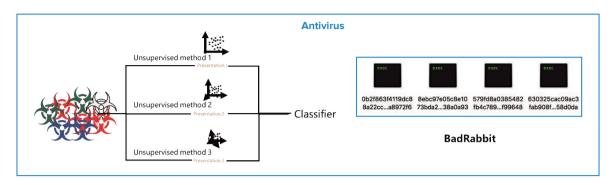

Endpoint security has evolved over the years from providing preventive capabilities, namely antivirus (AV) and next-generation AV, to a solution capable of correlating security events and performing investigation and response (EDR). Sangfor Endpoint Secure is a Modern Endpoint Protection Platform (EPP) that integrates NGAV, EDR, and endpoint management capabilities into a single solution. With Endpoint Secure, organizations can take preventive measures by scanning their endpoints for risky configurations and vulnerabilities, conduct investigations when security threats occur, and respond quickly with an easy-to-use solution. Endpoint Secure's endpoint management capabilities include vulnerability & patch management to mitigate risks and improve compliance. Centralized policy management and remote troubleshooting further help operations teams streamline and simplify O&M.

#### Architecture of Endpoint Secure

### Application Scenarios

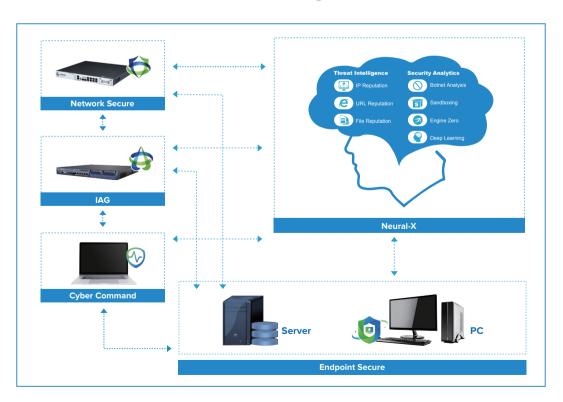

#### **Risk Scenario:**

Internal endpoints are widely deployed across multiple office networks. Attacks from unknown malware or ransomware significantly affect business critical applications, compromising the security of core organization data. Risk increases due to: 1. The lack of resources available to detect and respond to advanced and unknown threats prevent proactive defense. 2. Manual system management being inadequate when dealing with fast-moving and unknown threats - exposing the system to numerous attack surfaces.

#### **Endpoint Secure Application Effects:**

1. An Al core and the supplementation of the reputation database, gene and behavior analysis functions provides a 100% threat defense system capable of immediate and comprehensive detection and prevention.

2. Multi-dimensional innovative micro-segmentation technology and intelligent coordination of cloud-pipe-device functions provide immediate identification and response and comprehensive threat neutralization.

#### Device Linkage

#### **Risk Scenario:**

While most internal infrastructure utilizes firewall, intrusion prevention and other various border gateway devices, many gateway devices perform their own independent functions, preventing cohesive and effective security defense.

1. Gateway devices acting independently to prevent malicious attack means that once the boundary is breached, the malicious attacker propagates rapidly and can't be controlled.

2. Even if the external threat is known, effective shared linkage with the endpoint cannot be formed and endpoint control cannot be achieved.

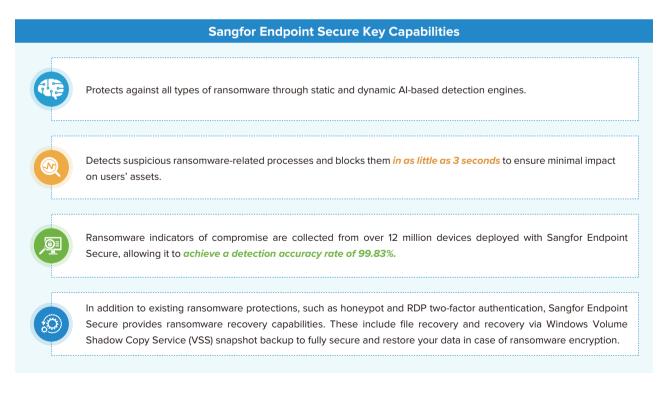

#### **Application Effects:**

1. Endpoint Secure can be coordinated and linked with Sangfor Neural-X, Network Secure, IAG and Cyber Command to form a defense structure covering the cloud, boundary and endpoint, sharing the internal and external threat information in real time.

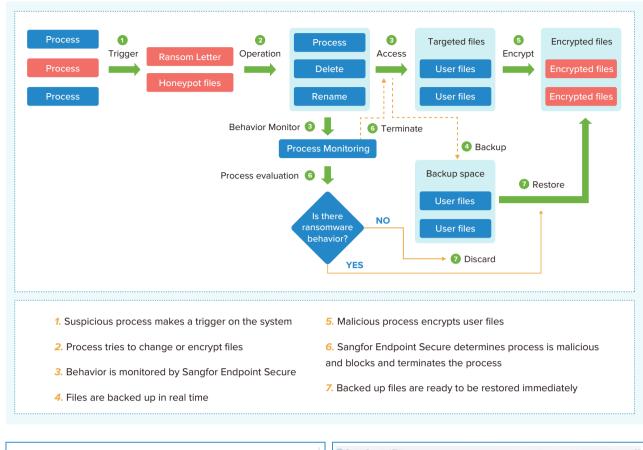

2. The Endpoint Secure intelligent linkage mechanism shares external threat information in a timely manner, allowing automatic response.

#### New Artificial Intelligent Antivirus Engine

Unlike traditional antivirus engines, Engine Zero has adopted artificial intelligence (AI) featureless technology, enabling effective identification of unknown viruses and variants, including those unlisted in the antivirus database.

Official performance testing conducted by AV-TEST awarded Sangfor Endpoint Secure a perfect 6 for Protection, Performance, and Usability, earning it the AV-TEST "TOP PRODUCT" award.

Detect Unknown Malware Accurately

Complete Antivirus Protection for	Business F	PCs	
	Industry average	July 2023	August 2023
Protection against 0-day malware attacks, inclusive of web and e-mail threats (Real-World Testing) 306 samples used	99.7%	100%	99.4%
Detection of widespread and prevalent malware discovered in the last 4 weeks (the AV-TEST reference set) 18,589 samples used	100%	100%	100%
